Artifact or science? Instrument signature removal (and adventures in telescope commissioning)

Merlin Fisher-Levine - August 1st 2022 - DESChool

Nobody is born knowing astronomy! (even if a few might seem like they were)

- Note to the experts
 - Some here will know ~everything
 - Some here will know ~nothing
 - Try to help people work things out for themselves.
- Let's encourage wrong answers!
- Format:
 - I tell you something
 - You discuss/apply
 - I give the "answer"

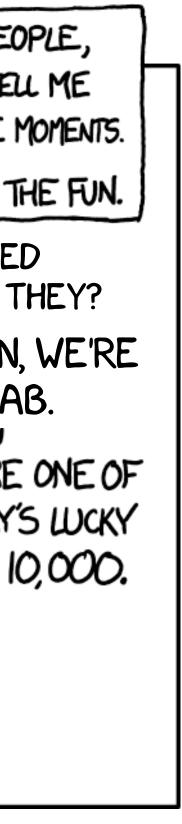

I TRY NOT TO MAKE FUN OF PEOPLE FOR ADMITTING THEY DON'T KNOW THINKSS.

BECAUSE FOR EACH THING "EVERYONE KNOWS" BY THE TIME THEY'RE ADVITS, EVERY DAY THERE ARE, ON AVERAGE, 10,000 PEOPLE IN THE US HEARING ABOUT IT FOR THE FIRST TIME.

FRACTION WHO HAVE = O%FRACTION WHO HAVE $\approx 100\%$ US BIRTH RATE ≈ 4,000,000/year NUMBER HEARING $\approx 10,000$ ABOUT IT FOR THE $\approx 10,000$ day FIRST TIME

IF I MAKE FUN OF PEOPLE, I TRAIN THEM NOT TO TELL ME WHEN THEY HAVE THOSE MOMENTS. AND I MISS OUT ON THE FUN. "CHARGED COUPLED DEVICES"? WHAT ARE THEY? OH MAN! COME ON, WE'RE GOING TO THE LAB. WHY? YOU'RE ONE OF TODAY'S WCKY

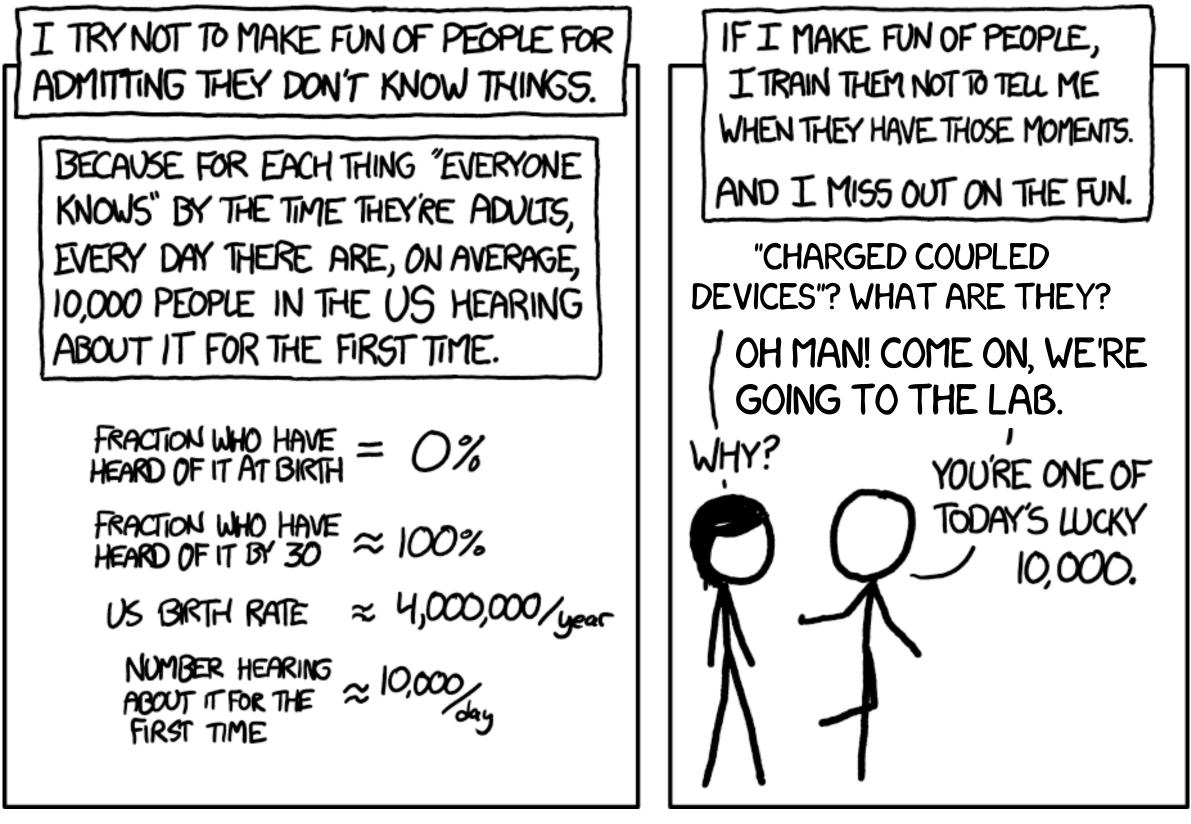

Saying "what kind of an idiot doesn't know about the brighter fatter effect" is so much more boring than telling someone about the brighter fatter effect for the first time.

Nobody is born knowing astronomy! (even if a few might seem like they were)

- Note to the experts
 - Some here will know ~everything
 - Some here will know ~nothing
 - Try to help people work things out for themselves.
- Let's encourage wrong answers!

 - I tell you something
 - You discuss/apply
 - I give the "answer"

There are some trickquestions / misleads to keep things spicy!

Saying "what kind of an idiot doesn't know about the brighter fatter effect" is so much more boring than telling someone about the brighter fatter effect for the first time.

Get to know your neighbours & work partners

- Zoom people: this is going to be intense there are a lot of smaller questions!
 - You'll go in and out of your established groups. The notice period for ending breakouts is set to 10s, so when the room here falls quiet you'll be yanked back.
- Who do we have: Thanks Pat =
 - Grad students/post docs/faculty etc?
- Level of experience/knowledge of CCD data and their pathologies on a scale of 1-10:
 - 1 = What is a CCD? How does a telescope work?
 - 10 = I am Jim [Gunn, Janesick, Chiang] / I literally wrote the book on this stuff Θ

The CCD revolution the two sides of the coin

- The good news...
 - is that they're not photographic plates!
- The bad news...
 - is how they behave.
- The ugly(ness)
 - is how the images look before correction...

Get it right or it's garbage in, garbage out!

- 100% quantum efficiency with no λ dependence
- No noise
- Perfectly linear response
- Can hold infinite electrons
- No memory of what came before, *i.e.*
 - The previous image
 - What's happened while collecting the image itself!

Bonus points: Aside from the points on this slide, why else is this image *not* representative of a CCD image?

Quick end-to-end overview

- → Atmosphere
- \rightarrow telescope, optics etc
- \rightarrow bulk silicon \rightarrow collecting wells
- \rightarrow row & column (parallel & serial) shifts \rightarrow digitisation
- \rightarrow DAQ & file writing
- \rightarrow Rendering (because numbers aren't pictures)

• The universe, just sitting there, waiting to be photographed $\{$ Our signal $\{$

Here be dragons 😹 😑

Quick end-to-end overview The universe

- Sits there and does its thing no problems there by definition 👌
- Obviously one person's signal is another person's noise/ background/headache, but that that's their problem!
 - Deblending
 - Low surface brightness stuff
 - "Moving objects"
- As far as we're concerned for the "is it the instrument?" question, everything outside of the atmosphere and which is not orbiting the earth is "signal".

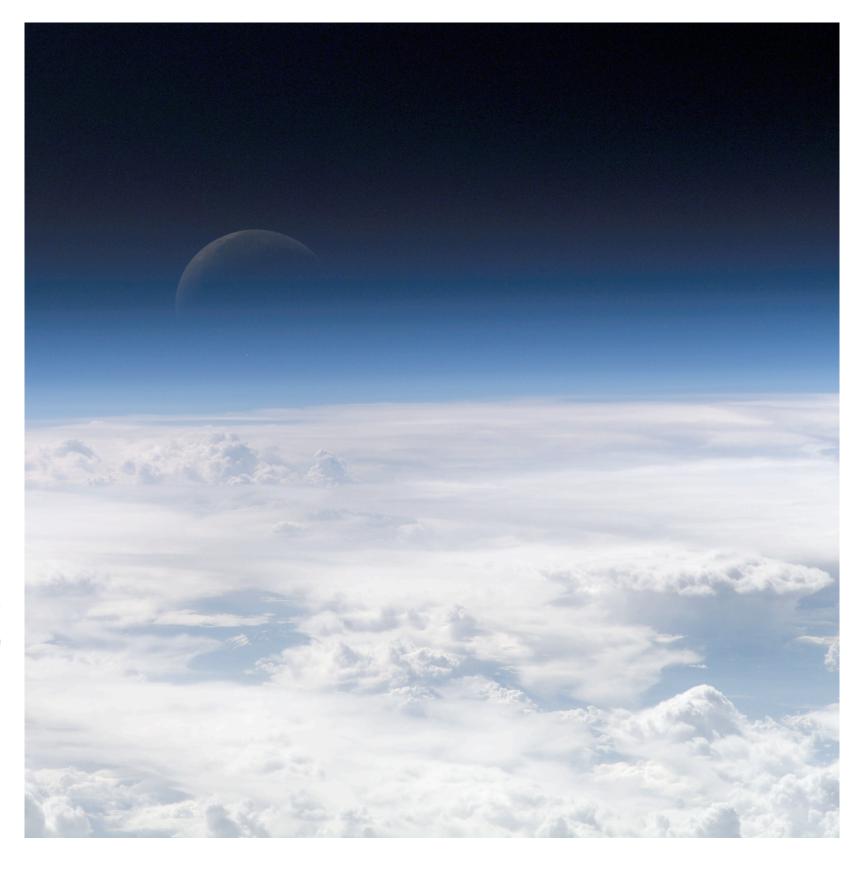

Al-generated image from DALL-E 2 using the prompt "Painting of the universe posing for a picture with a photographer".

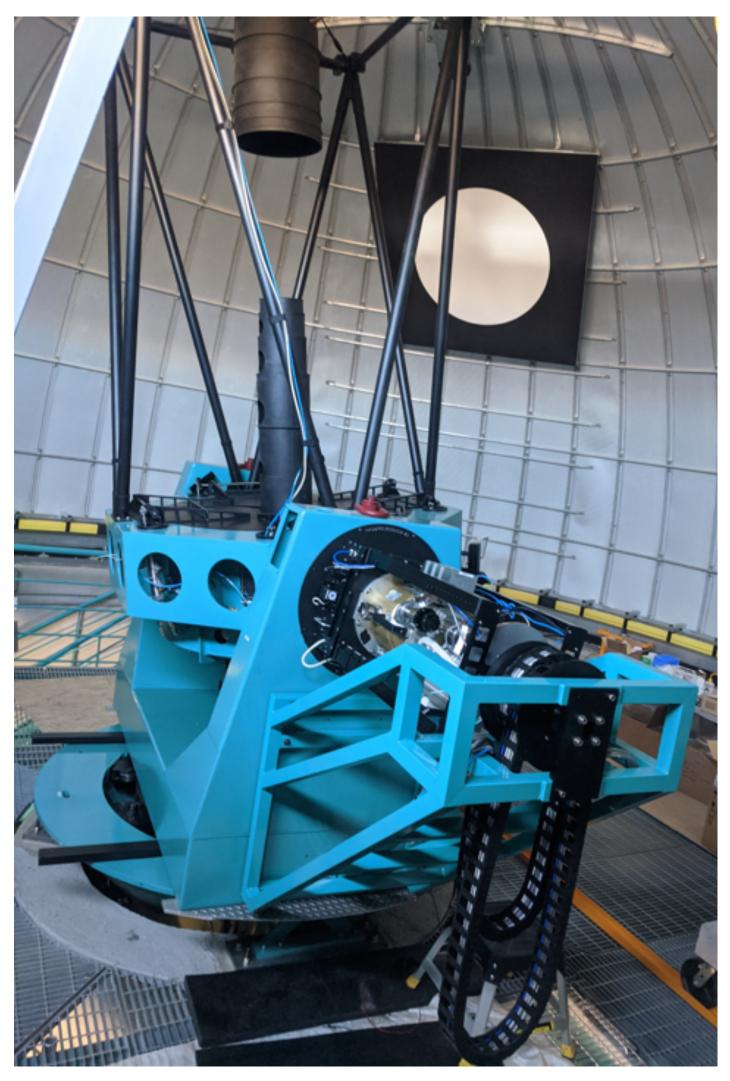

Quick end-to-end overview The atmosphere

- It's thick and therefore blurry
 - Thickness varies with elevation angle, from 1 to
- It's refractive
- It's both emits and absorbs light!
- Things fly through/just above it X (and even X V)
- It's also windy, dewey, rainy and snowy, but these are (mostly) operational problems, though not entirely...

Quick end-to-end overview The telescope & optics

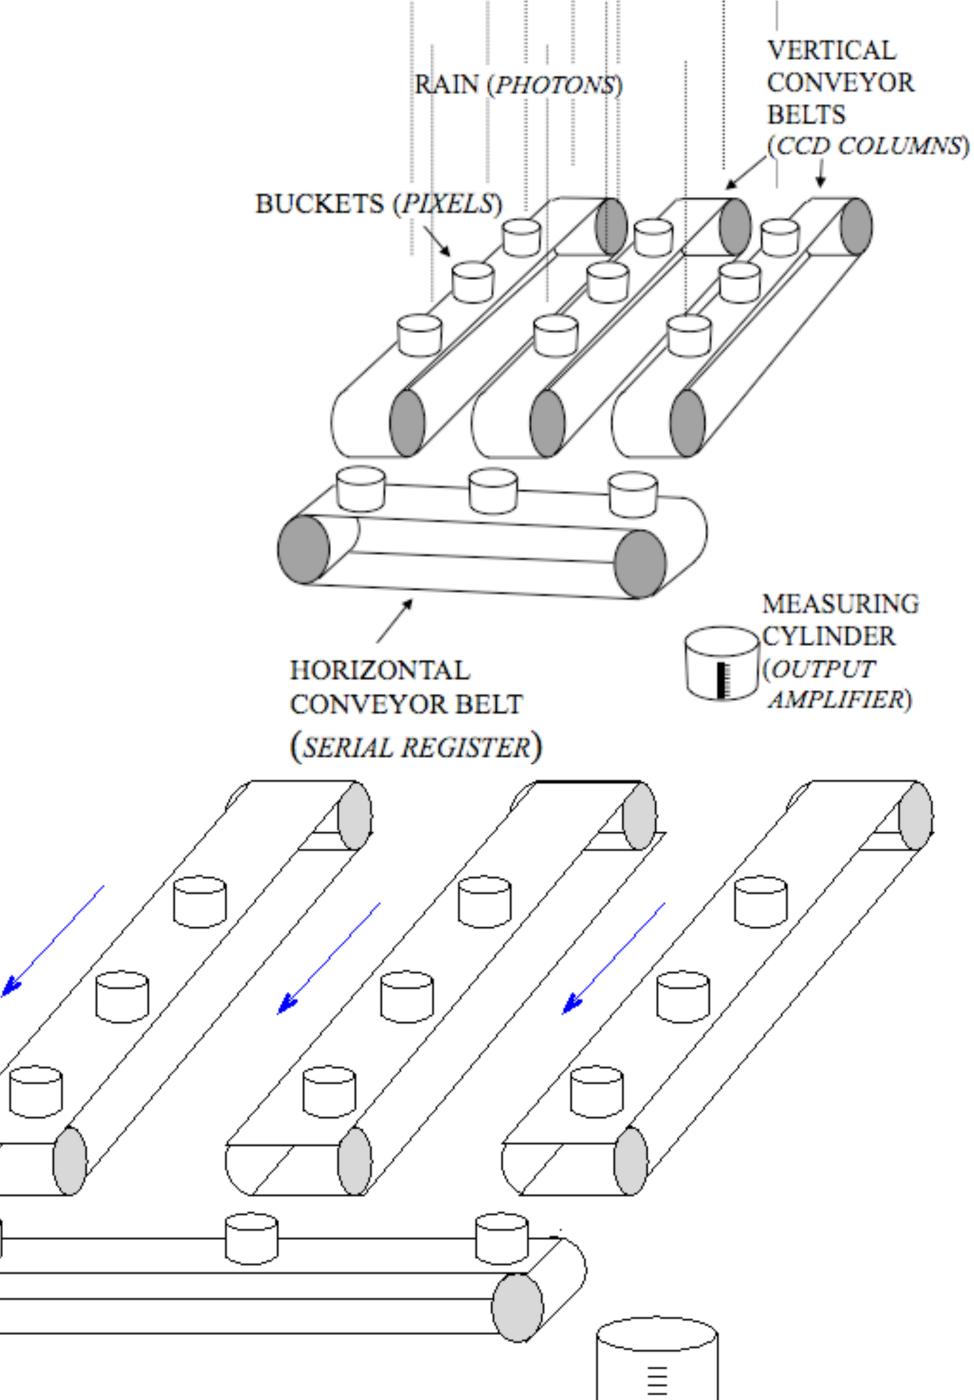

- It has to track the sky
 - Sometimes with two axes, sometimes three
 - Rubin has three for both the AuxTel & the main telescope
- It has finite rigidity
- It has to be collimated & in focus
- It should try to not have a significant wavelength dependence
- It gets dusty

Quick end-to-end overview The silicon

- Light hits silicon, converts into electron/hole pairs
 - Not just light muons, soft electrons, etc...
- Gets collected in potential wells on the backside
- Read out by the bucket brigade
 - Row & column shifts
- What needs to be true of the serial register?

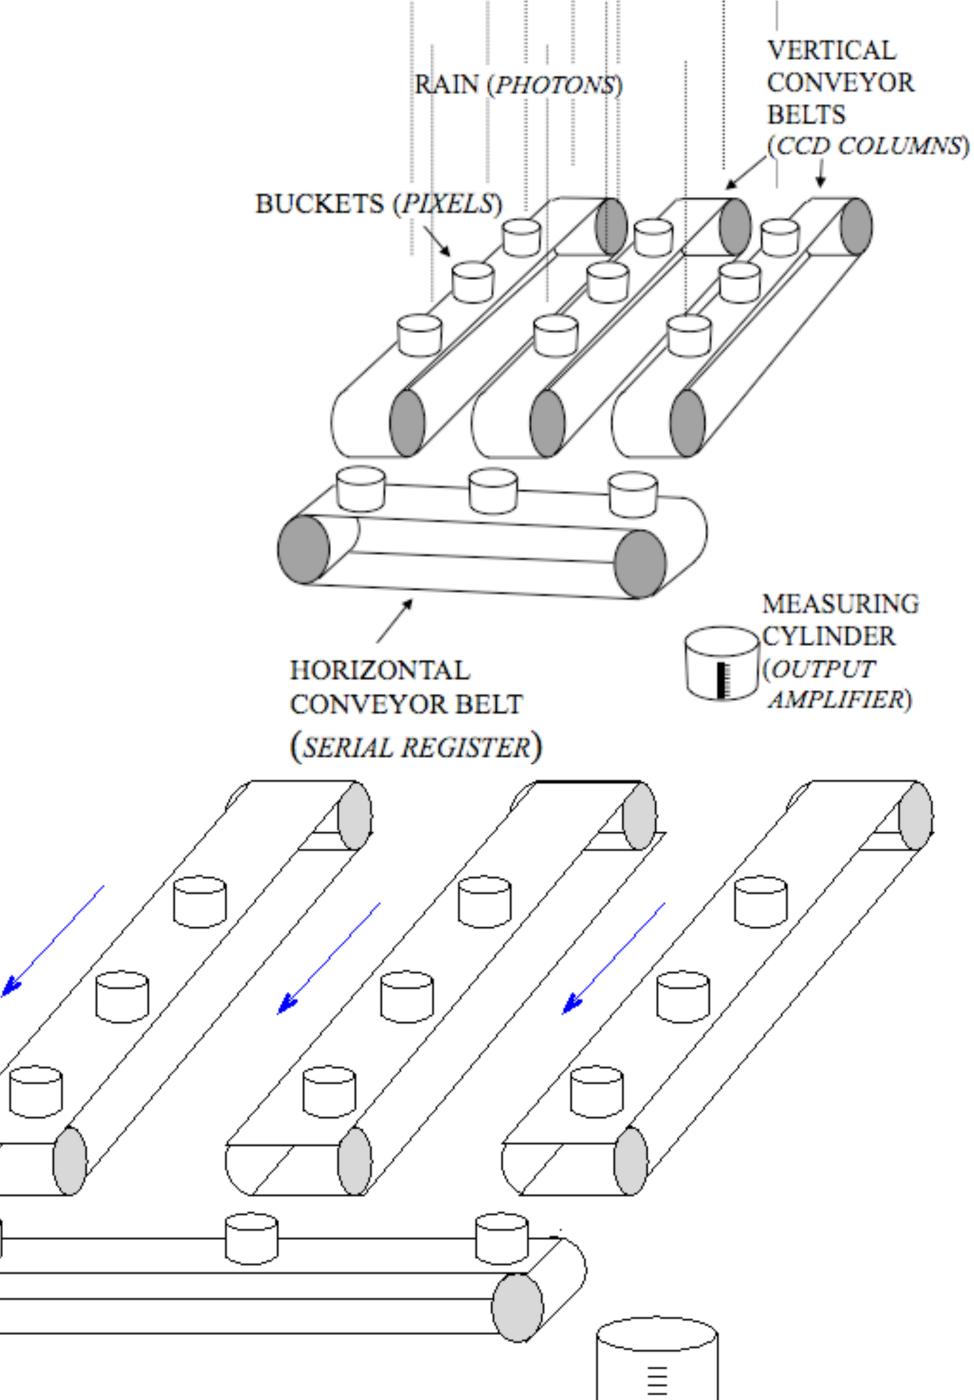

Image credit: <u>Vik Dhillon</u>

Quick end-to-end overview The silicon

- Light hits silicon, converts into electron/hole pairs
 - Not just light muons, soft electrons, etc...
- Gets collected in potential wells on the backside
- Read out by the bucket brigade
 - Row & column shifts
- What needs to be true of the serial register?

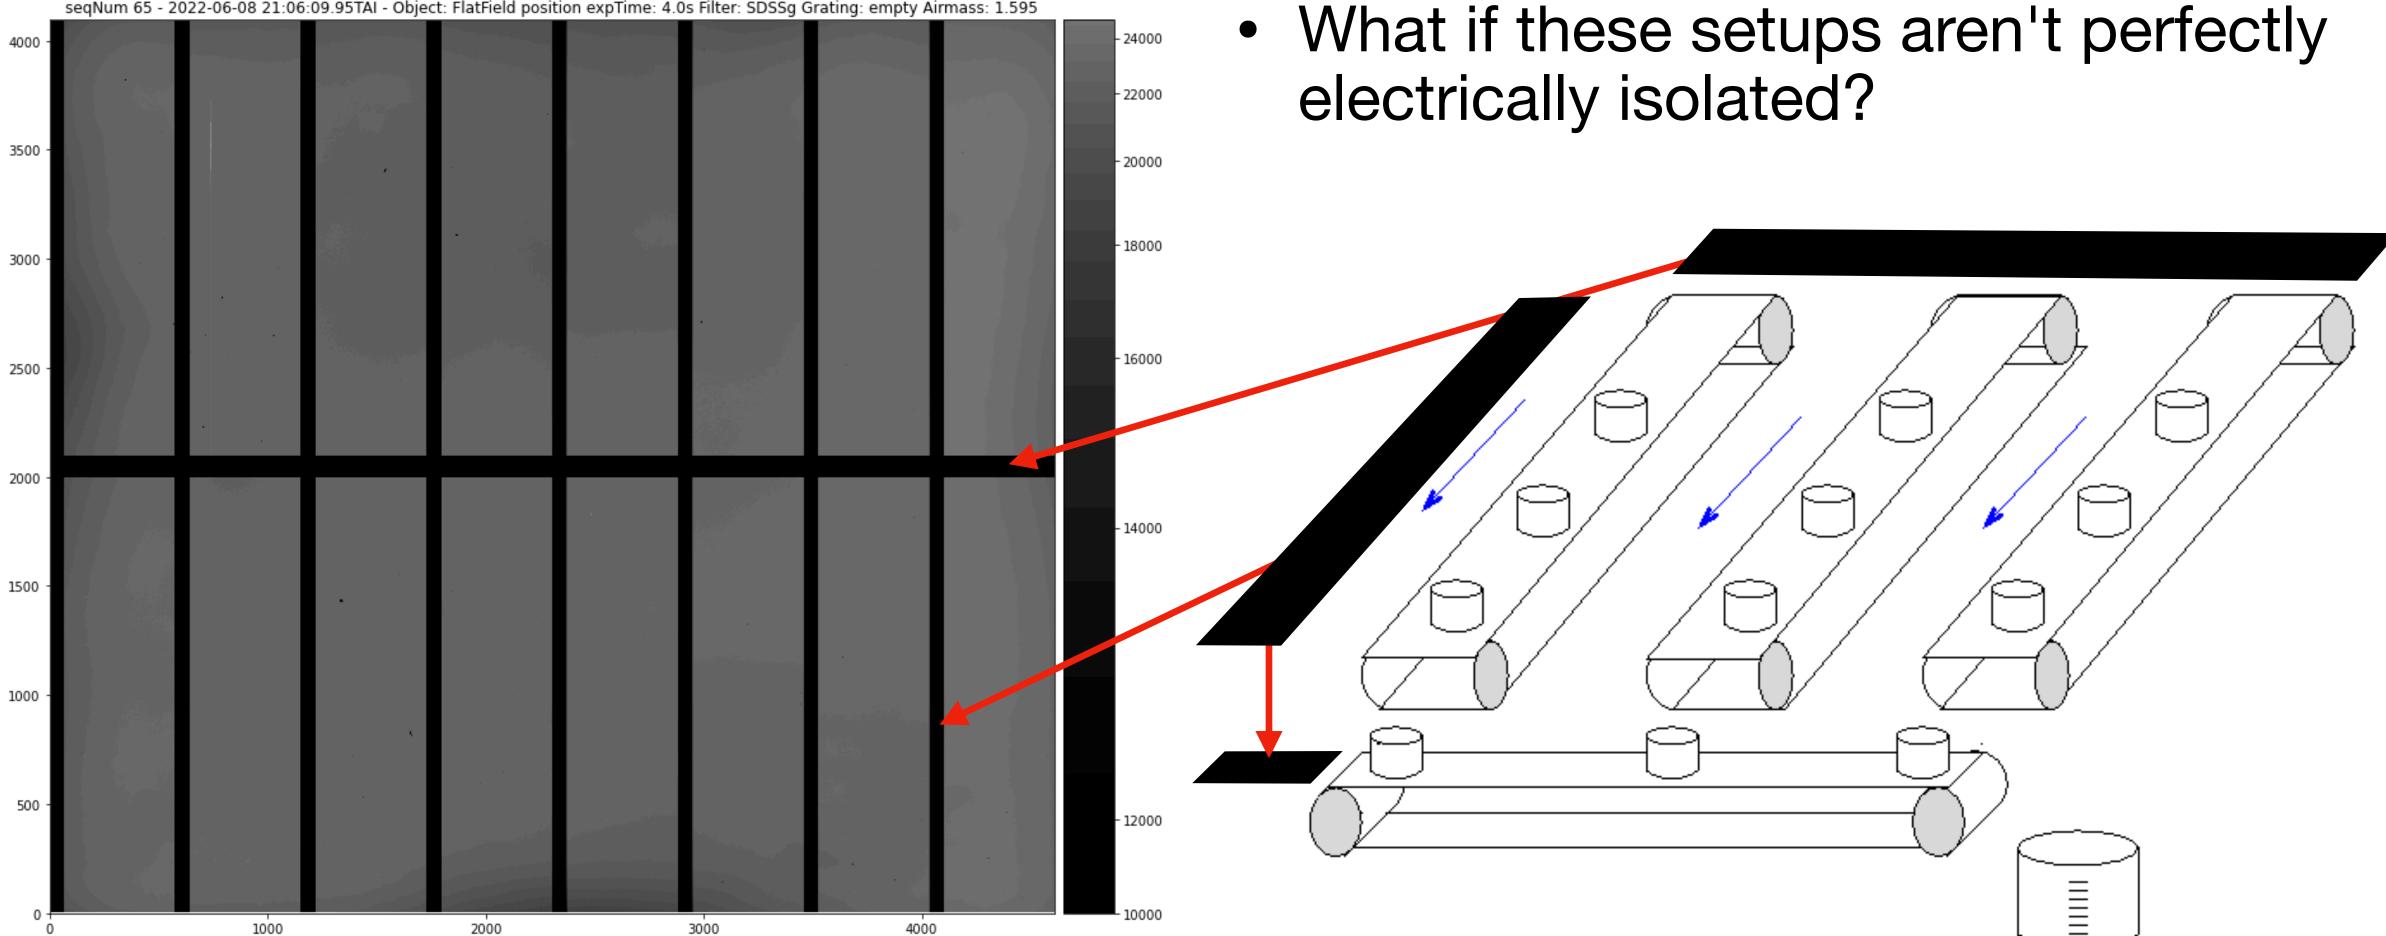

Image credit: <u>Vik Dhillon</u>

Overscans and subtraction

What happens if we keep clocking out and reading once all the buckets are empty?

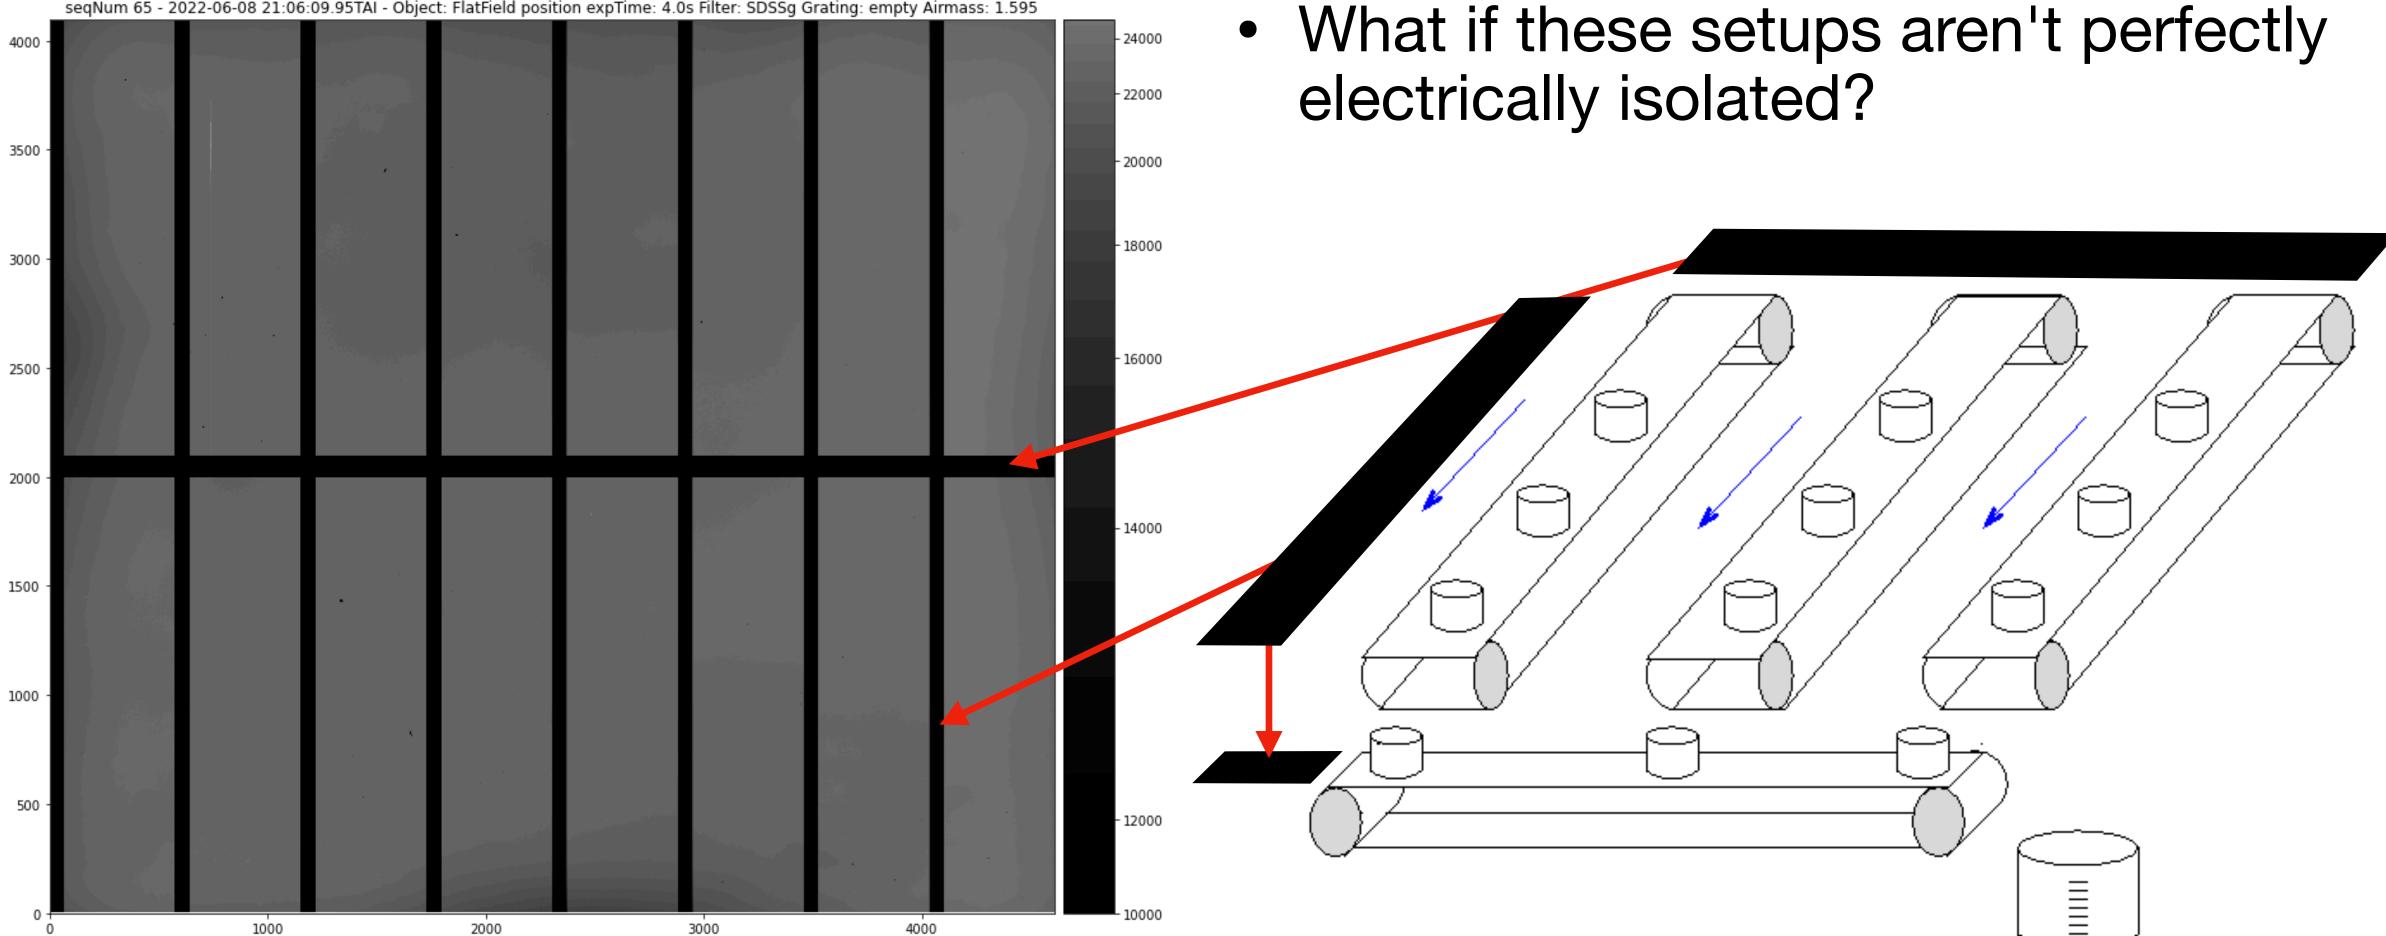

Object: FlatField position expTime: 4.0s Filter: SDSSg Grating: empty Airmass: 1.595

Overscans and subtraction

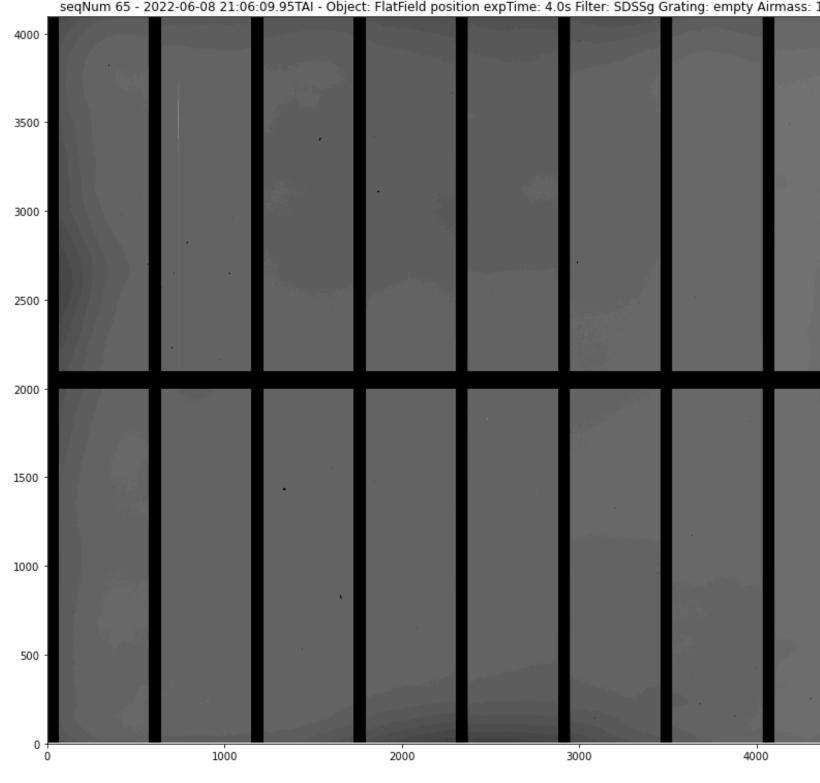

What happens if we keep clocking out and reading once all the buckets are empty?

Object: FlatField position expTime: 4.0s Filter: SDSSg Grating: empty Airmass: 1.595

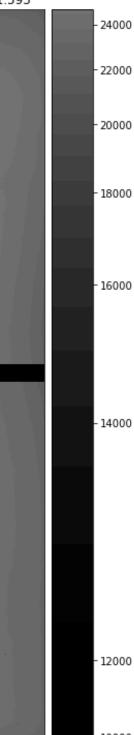

Quick end-to-end overview **Readout & digitisation**

- Amplifiers:
 - We divide our chip into 16 amplifier to read out faster
- ADCs
 - We digitise the signal at 18 bits, with the gain tuned in order to sample the full well charge and the noise
- DAQs
 - This firehose of bits (>3 \times 10⁹ pixels at 18 bits in 2 seconds flat) has to be recorded!

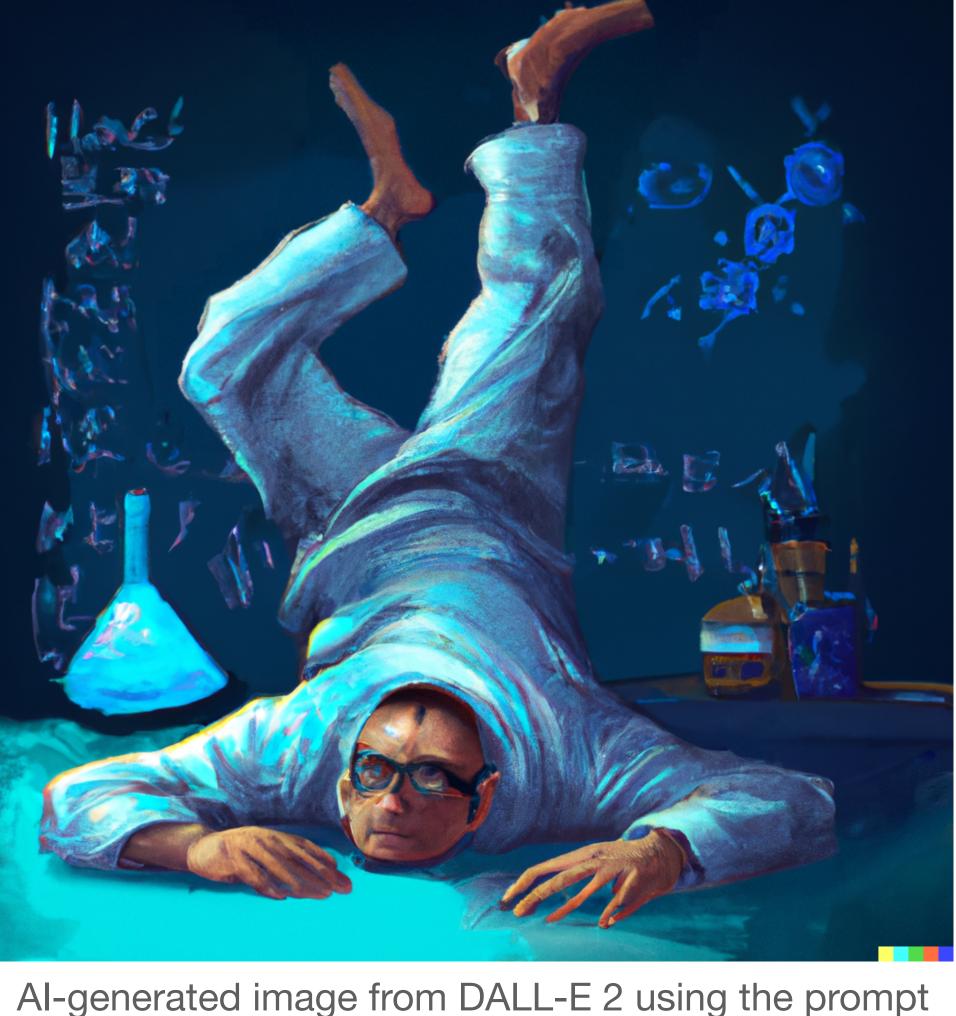

Quick end-to-end overview Rendering

- Your analysis algorithms can work on the raw (calibrated) data
- But you can't just look at numbers!
- A bad stretch is just as dangerous for interpreting your data as it is for my back!

"A scientist in distress while doing backbend in yoga in a chemistry lab, digital art".

Two quick things you'll need to "just know"

Donuts

3500 -

3000

- Why do stars look like donuts?
- Not an accident, or a problem for once!
- Used for focusing

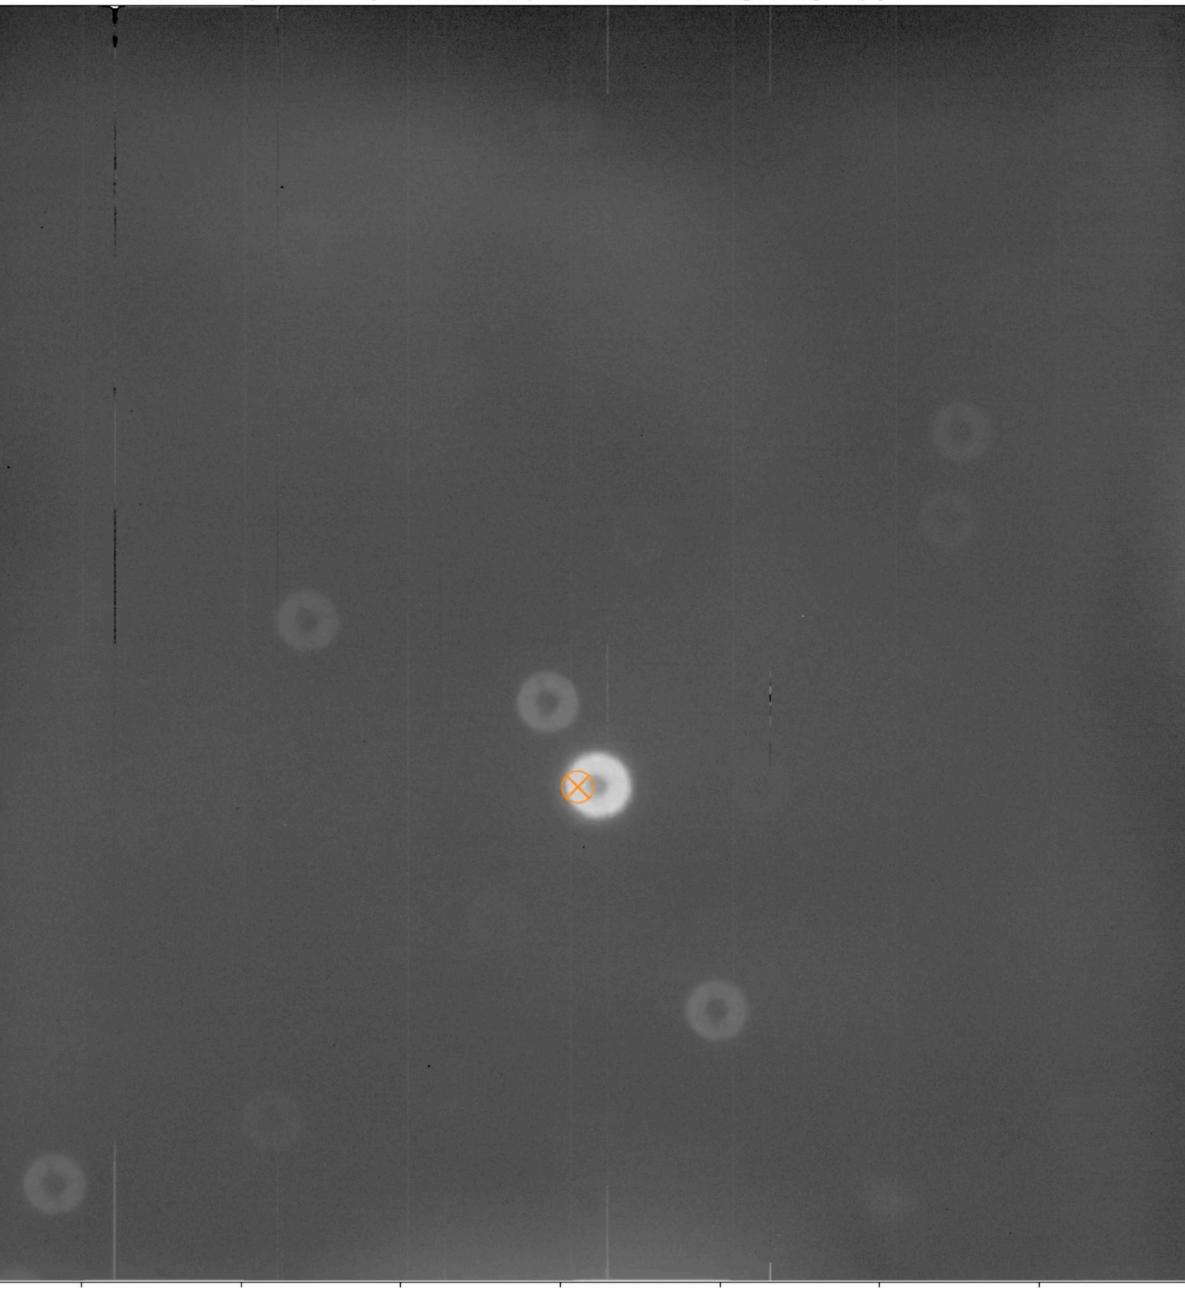

2000 -

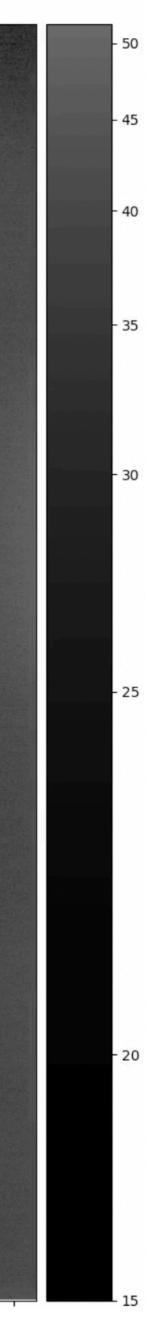

2500

1500

1000

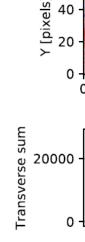

500

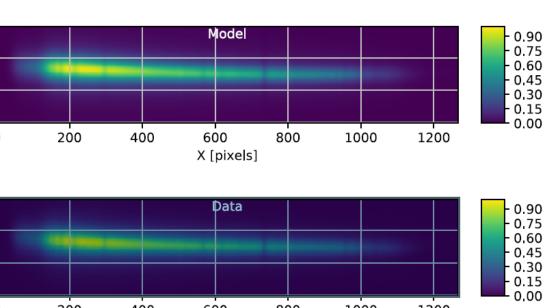

Spectra

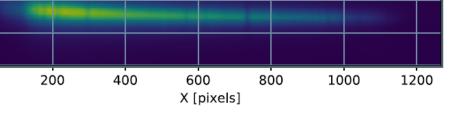

- Why do stars look like lines?
- Not an accident, or a problem for once!
- This is a spectrograph, so when there is a disperser in the beam we get a spectrum

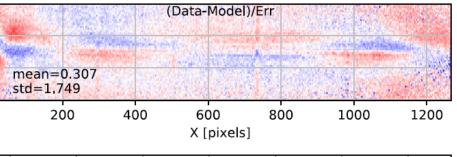

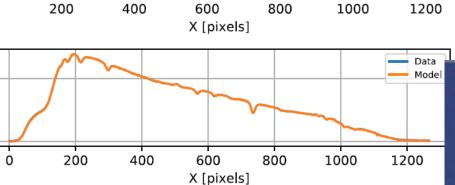

[pixels] 50

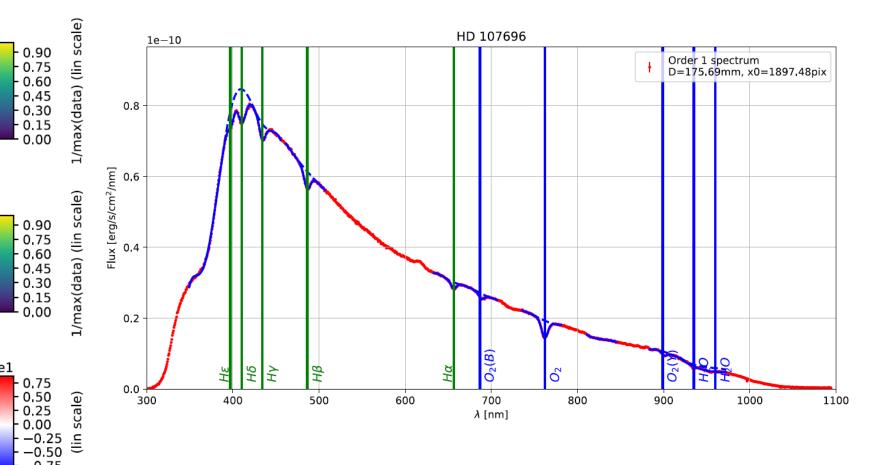

0

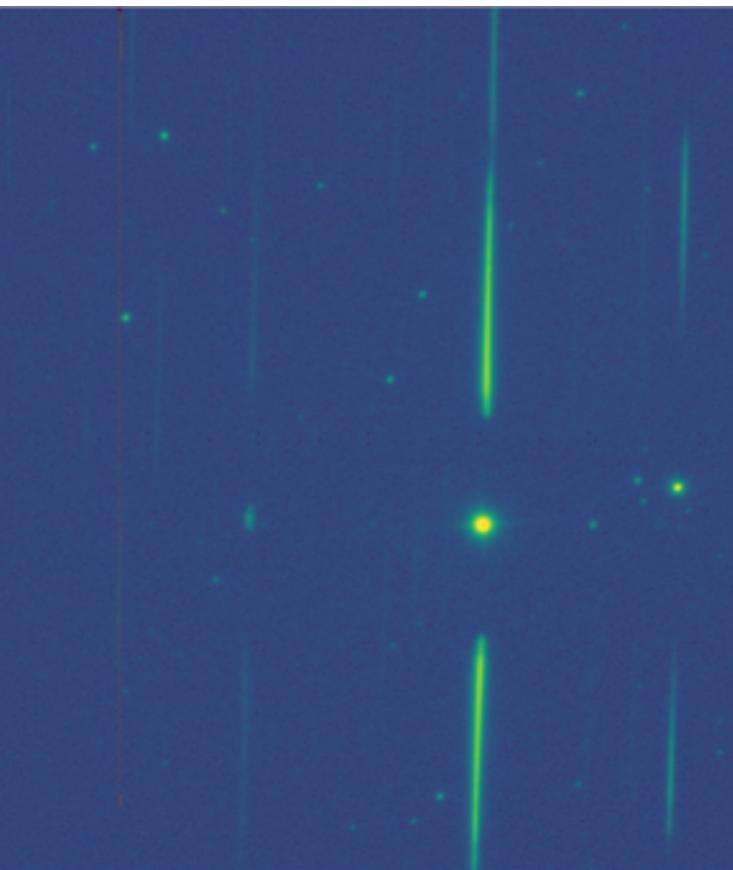

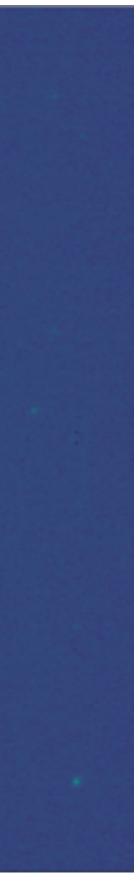

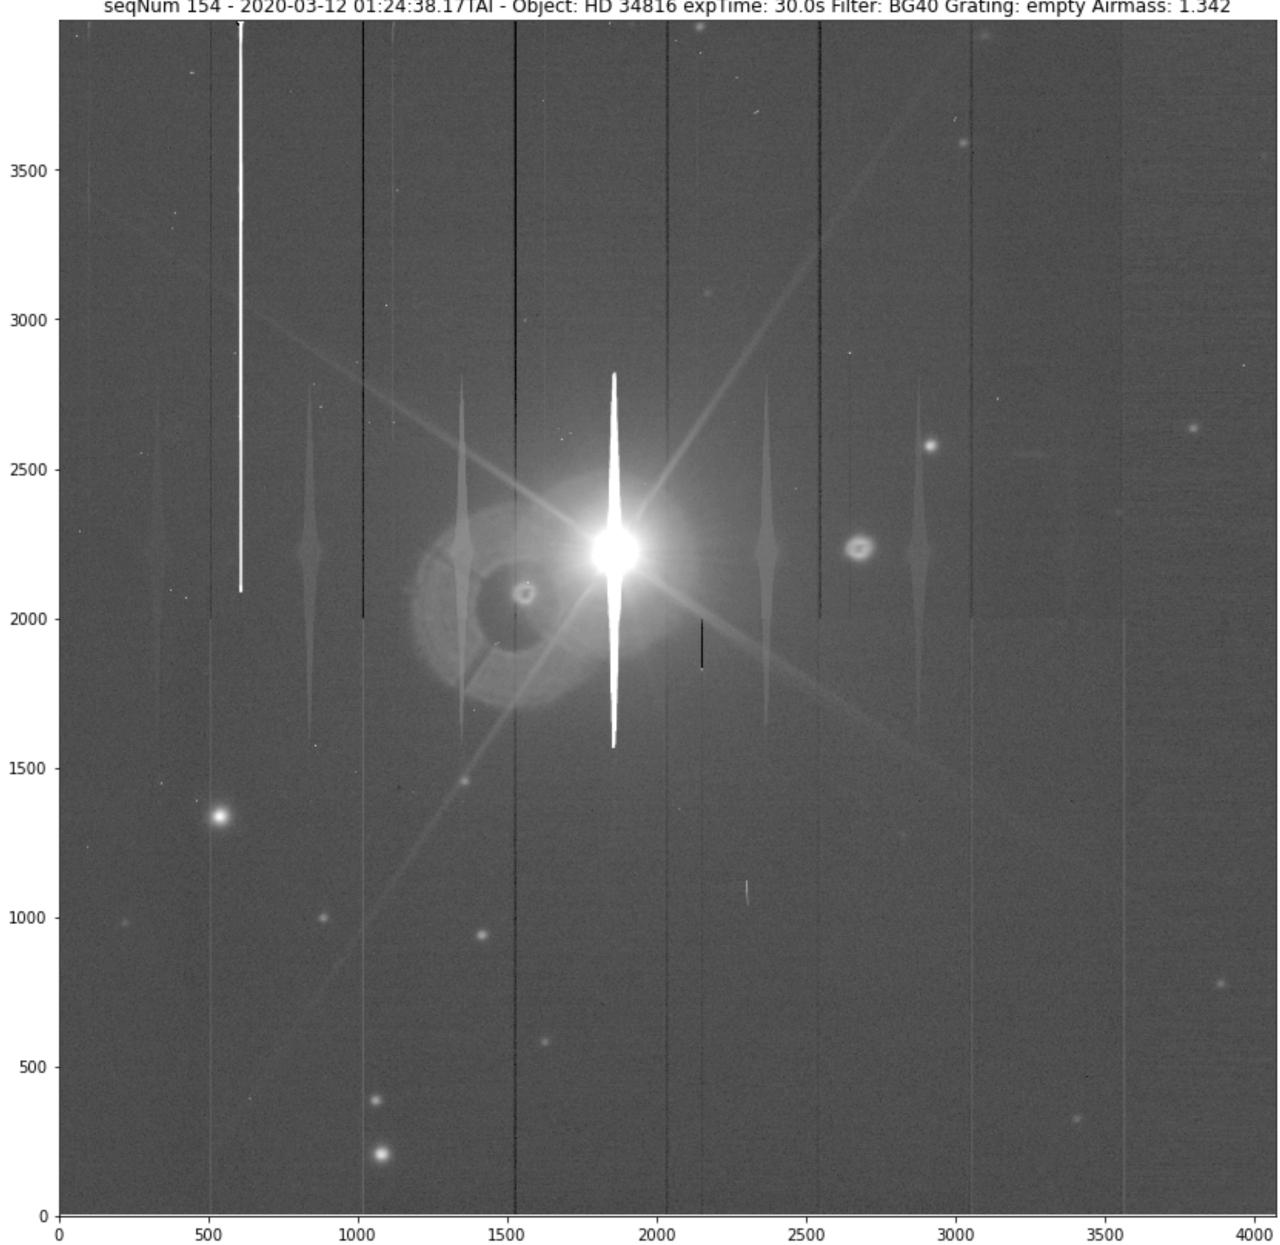

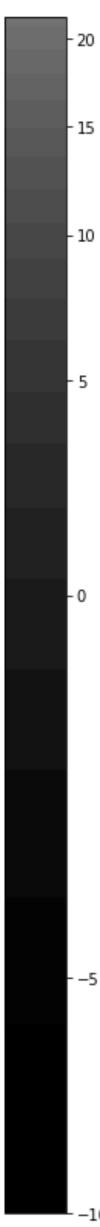

Now you know everything so let's put it all together!

Group work

 In groups, list everything you can see going on

More examples of corruption

-- qrit

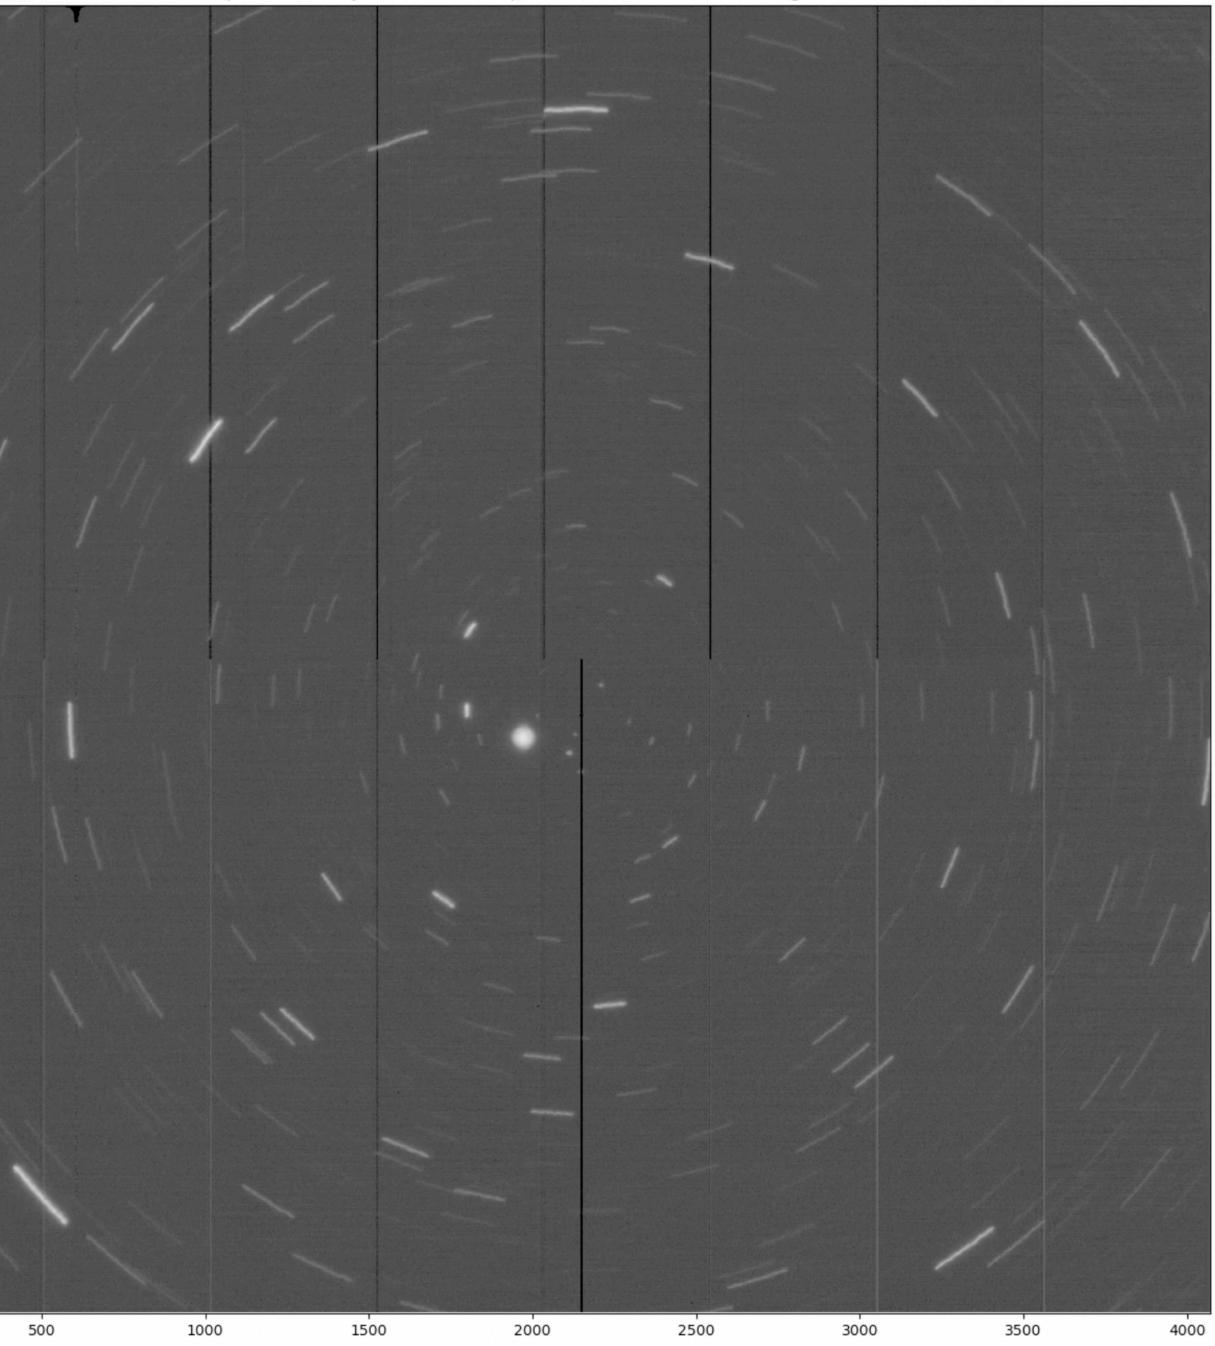

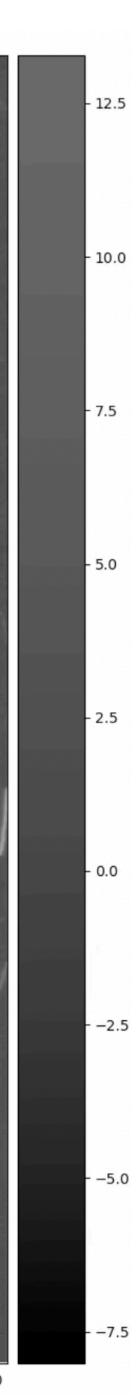

Quick fire round:

1000 -

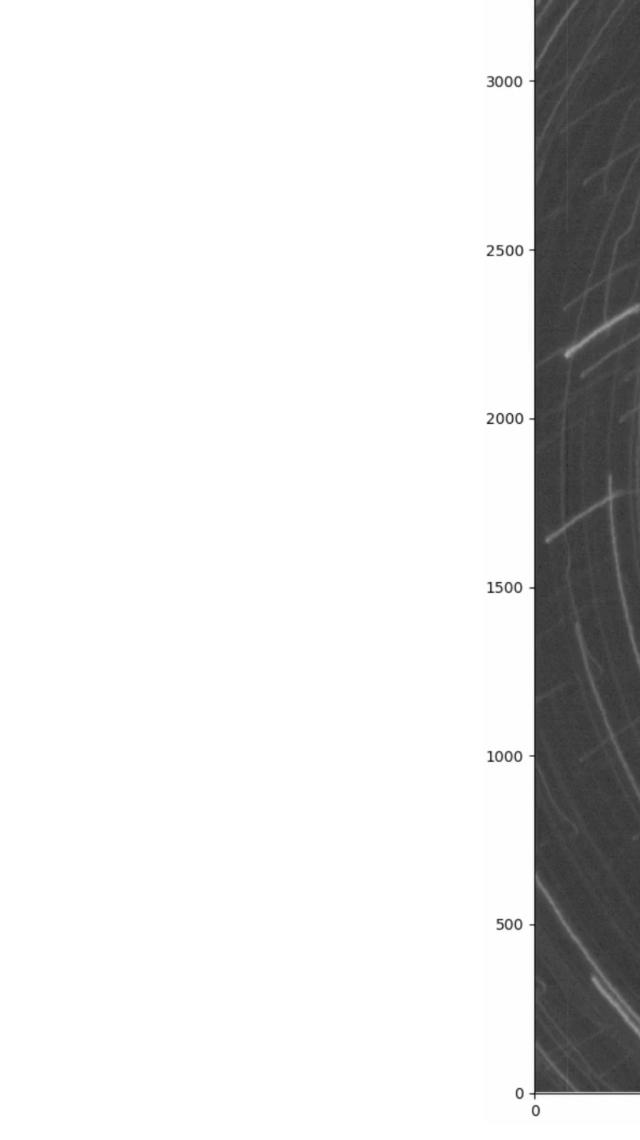

3500

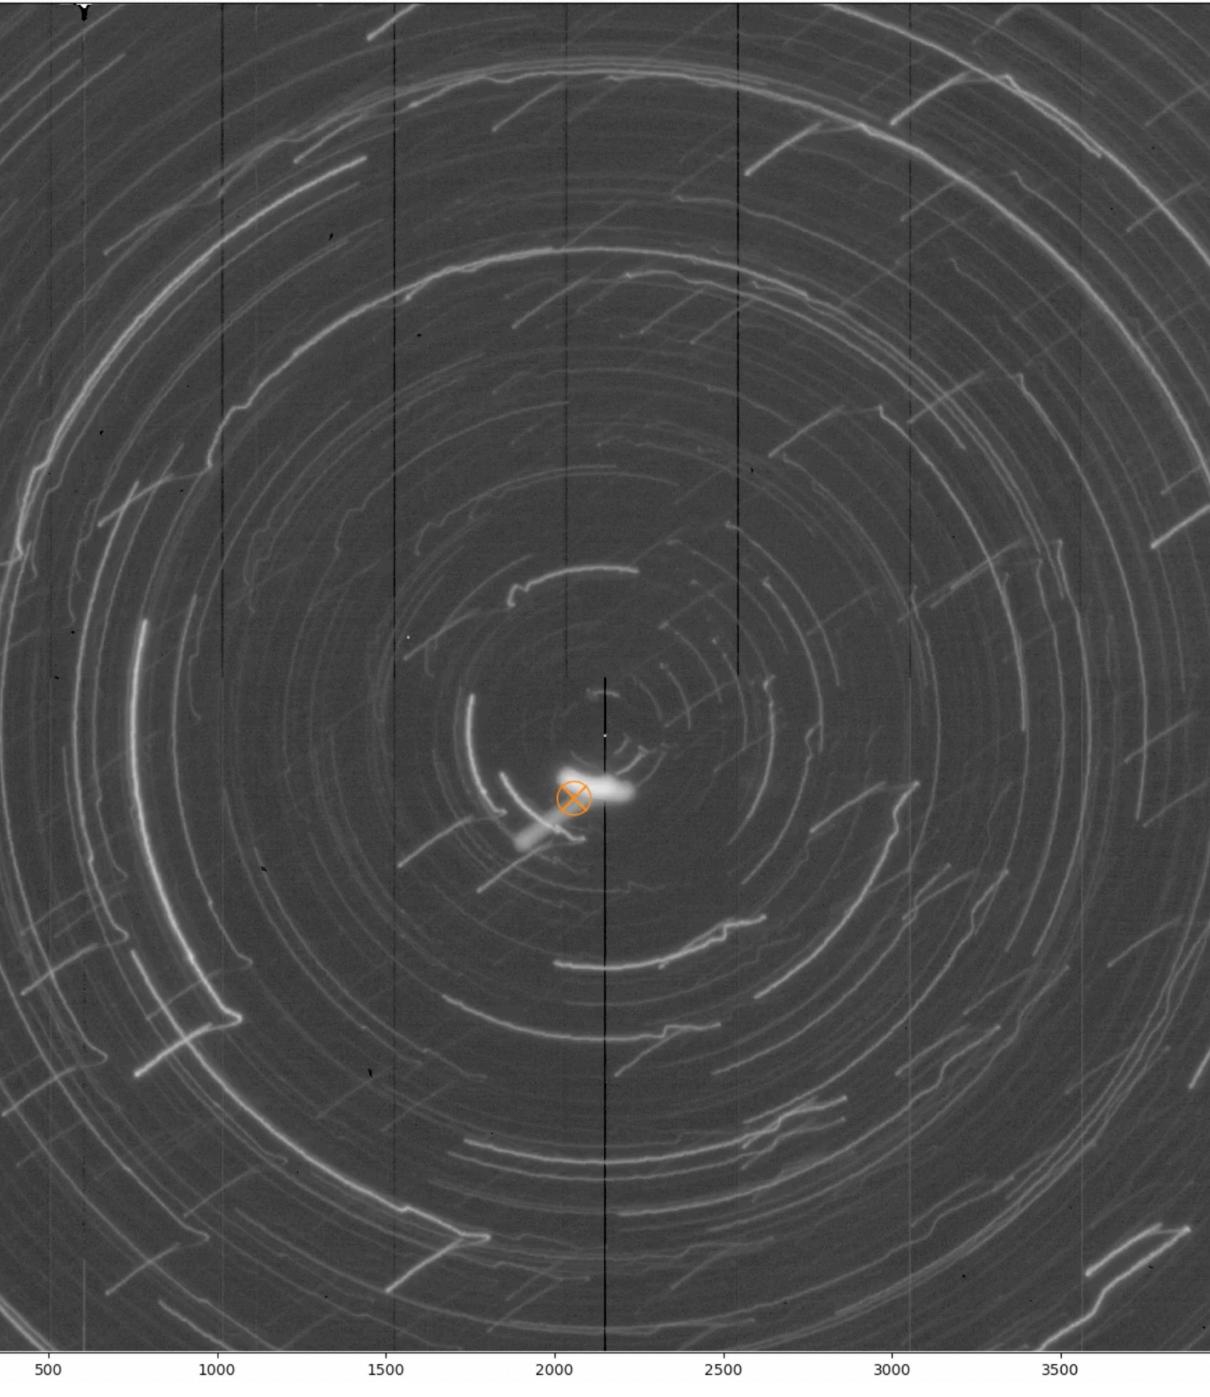

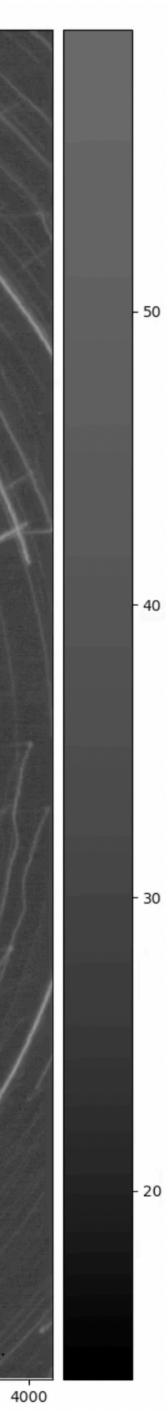

Quick fire round:

3500 -

Let's list all the effects Yes, it's quite a long list...

- Bleed trails • CTI (if it's bad enough)
- Cosmic rays
- Physical damage to the CCD
- Bright defects
- Dark defects
- Glowing amplifiers
- Bias structure

- RF pickup
- Data corruption
- Diffraction spikes
- Ghosts
- Crosstalk
- Vignetting

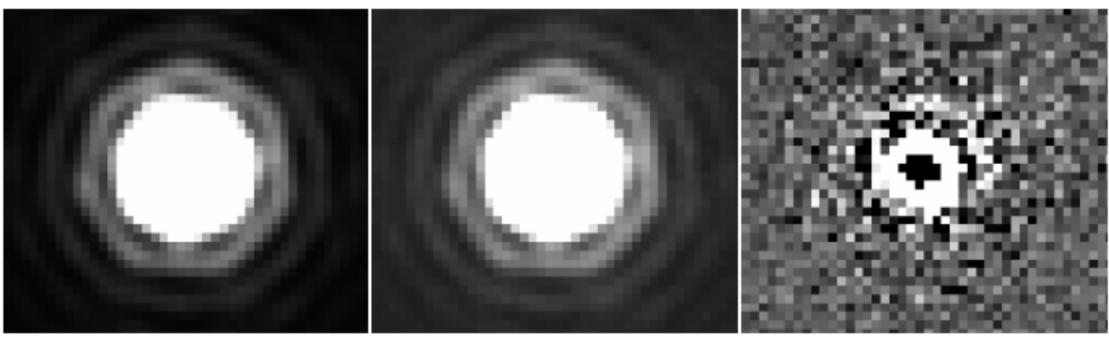

- Occlusion
- QE variations
- Fringing
- Pointing problems
- Satellites
- Tearing

What did we miss?

- Some effects are directly visible in the images, some are not:
 - Linearity & gain variations
 - Brighter-fatter effect
 - Tree rings (there, but far too subtle to see)
- Most others can be seen...

Brighter-fatter effect

- Why does it happen?
- How do we know?
- How do we correct for this?

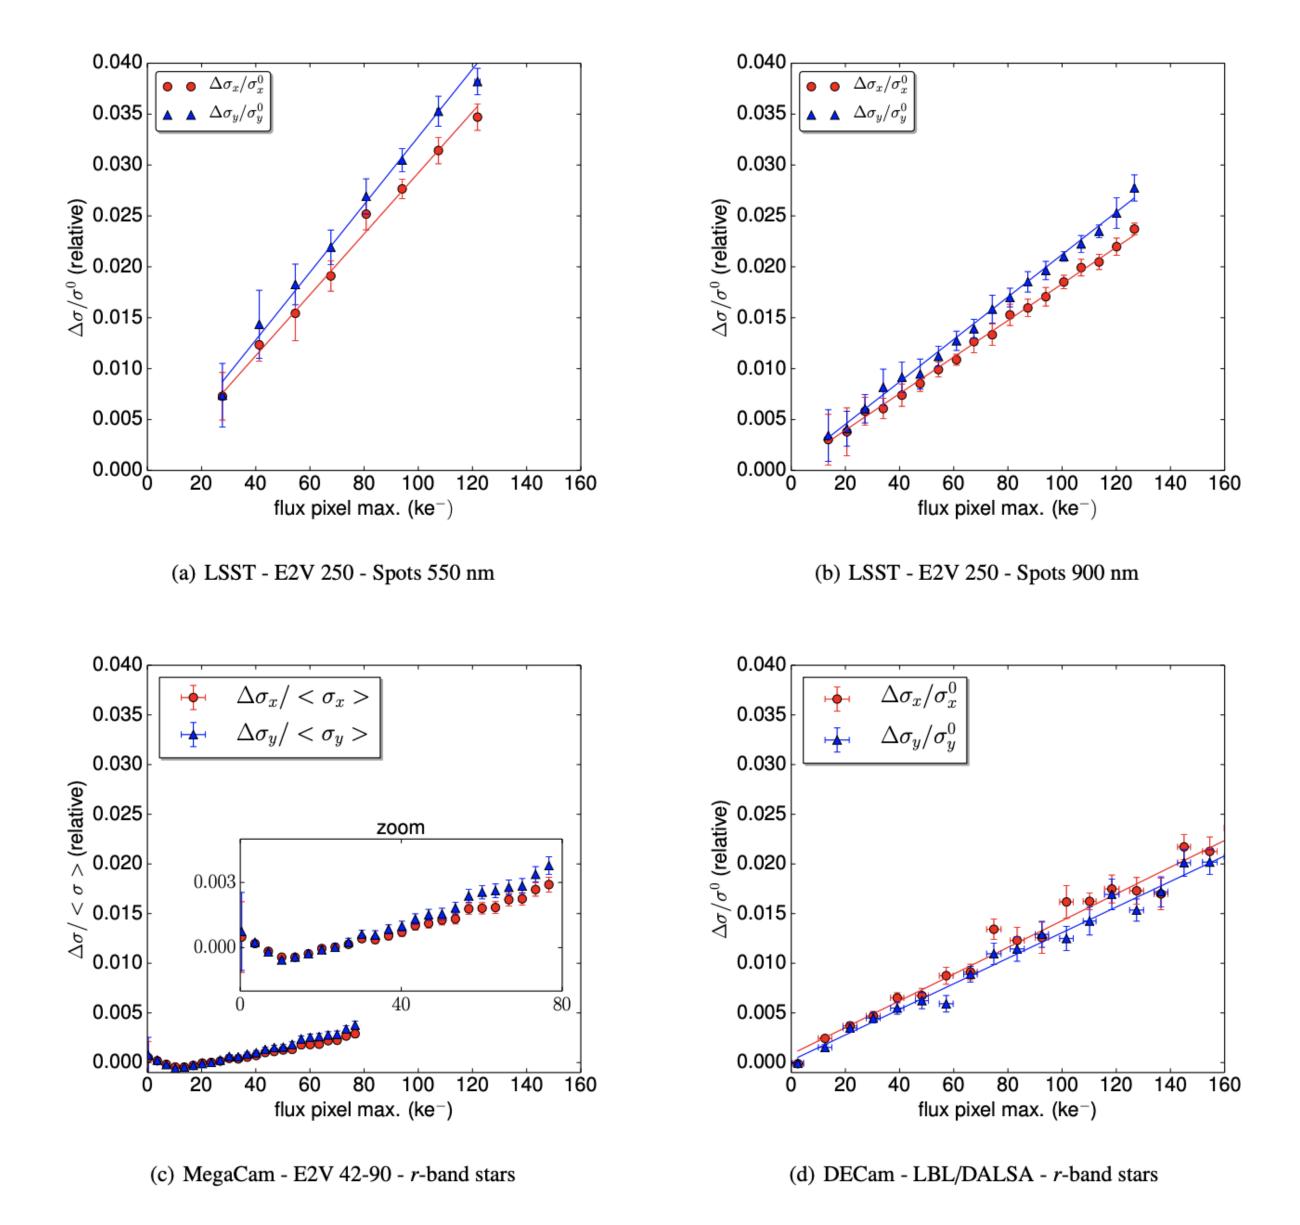

(a) 200-s exposures

(b) 20-s exposures

(c) subtraction (a)-(b)

Guyonnet+15

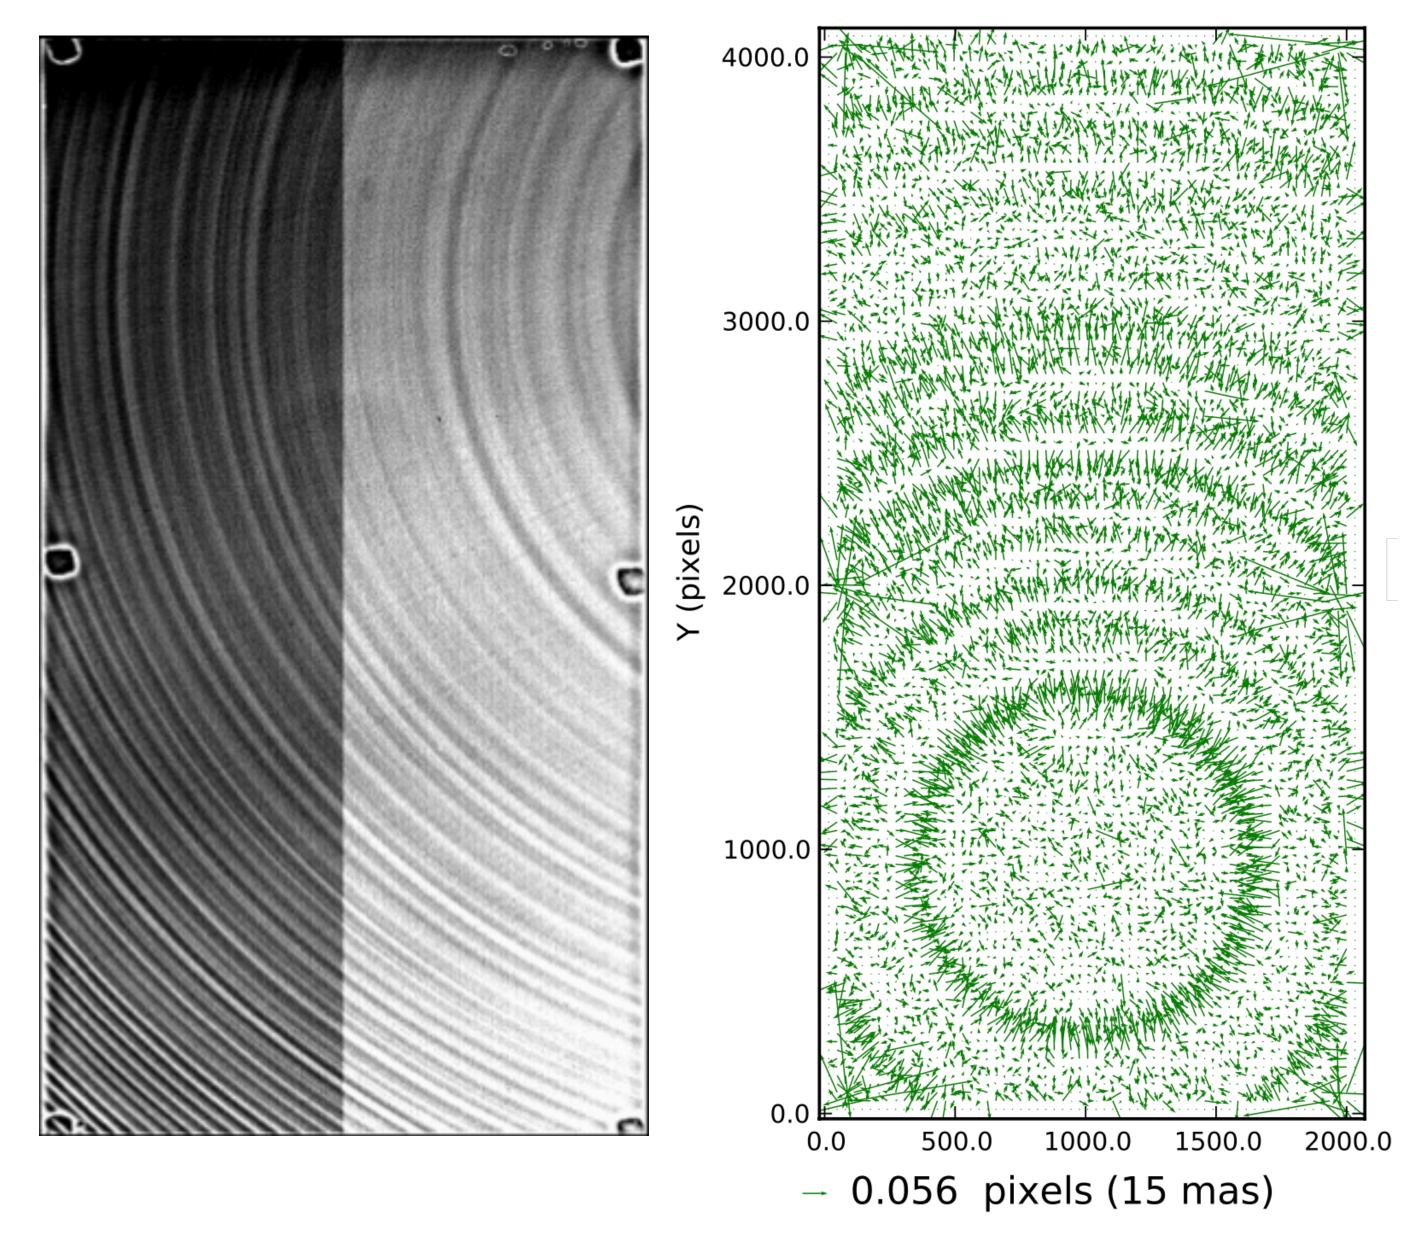

Guyonnet+15

Tree rings

- Silicon boules are grown
- Impurities in the gas vary
- Lateral electric fields
- Astrometric distortion

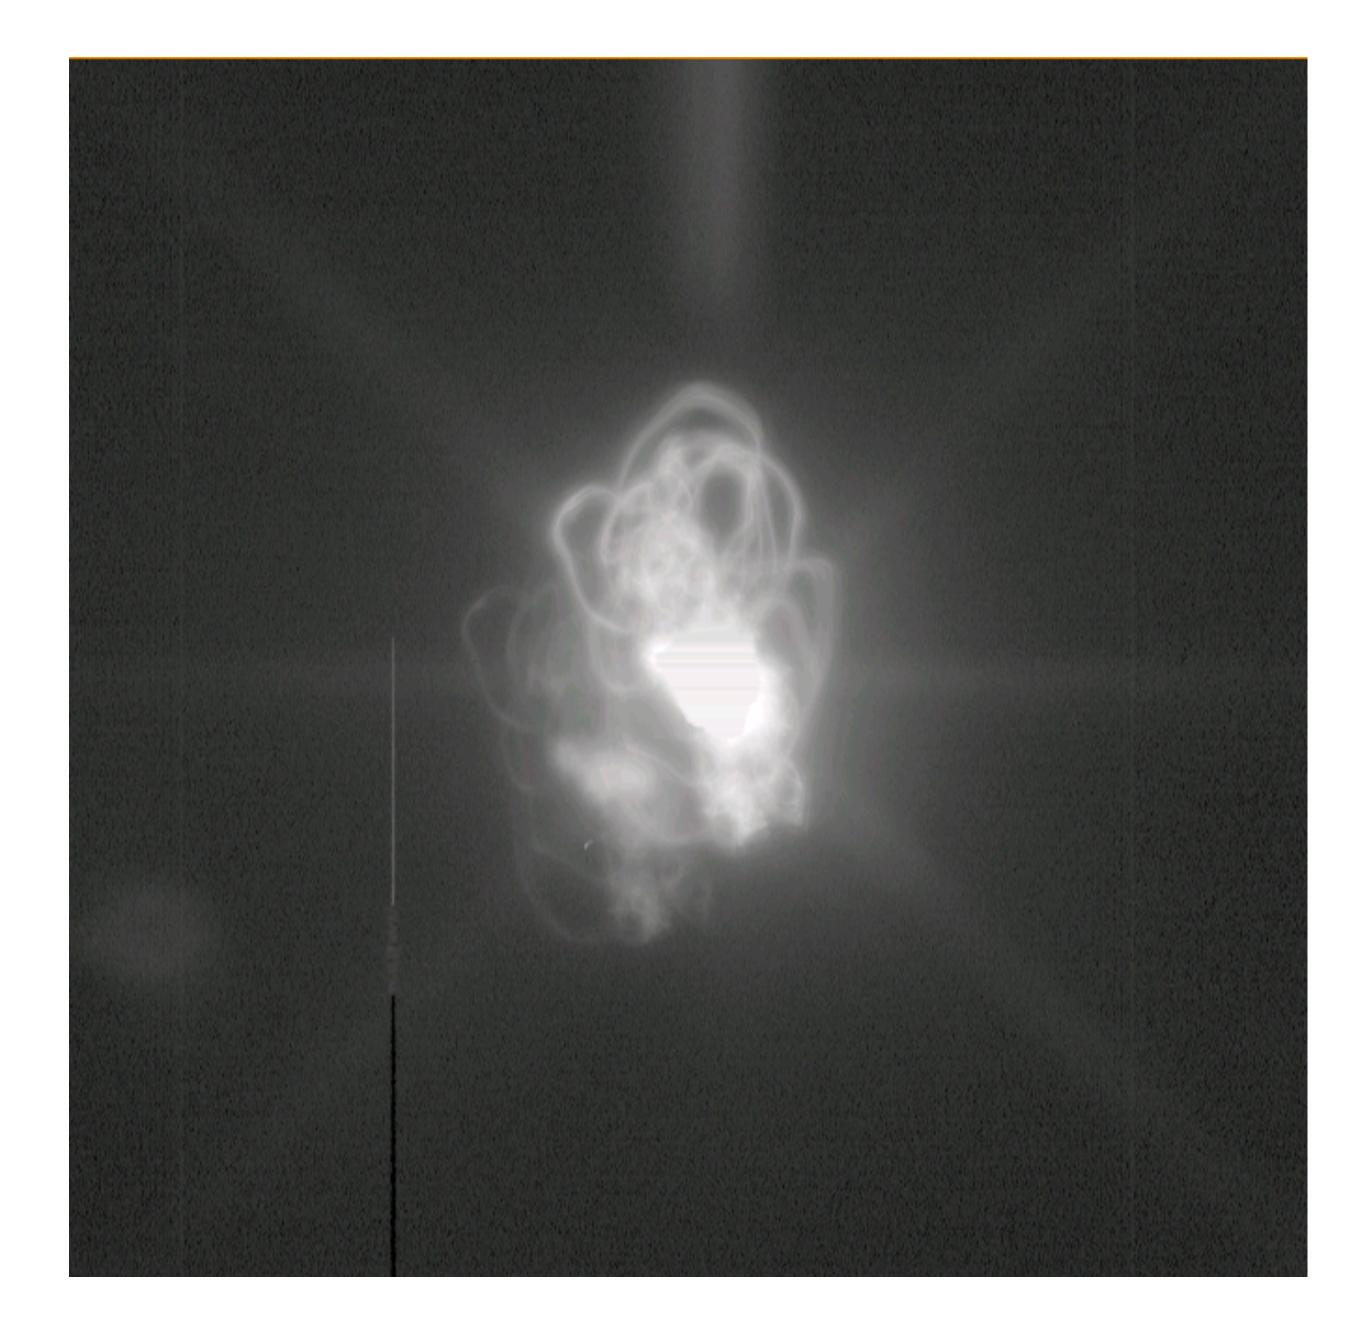

A silicon boule, as grown

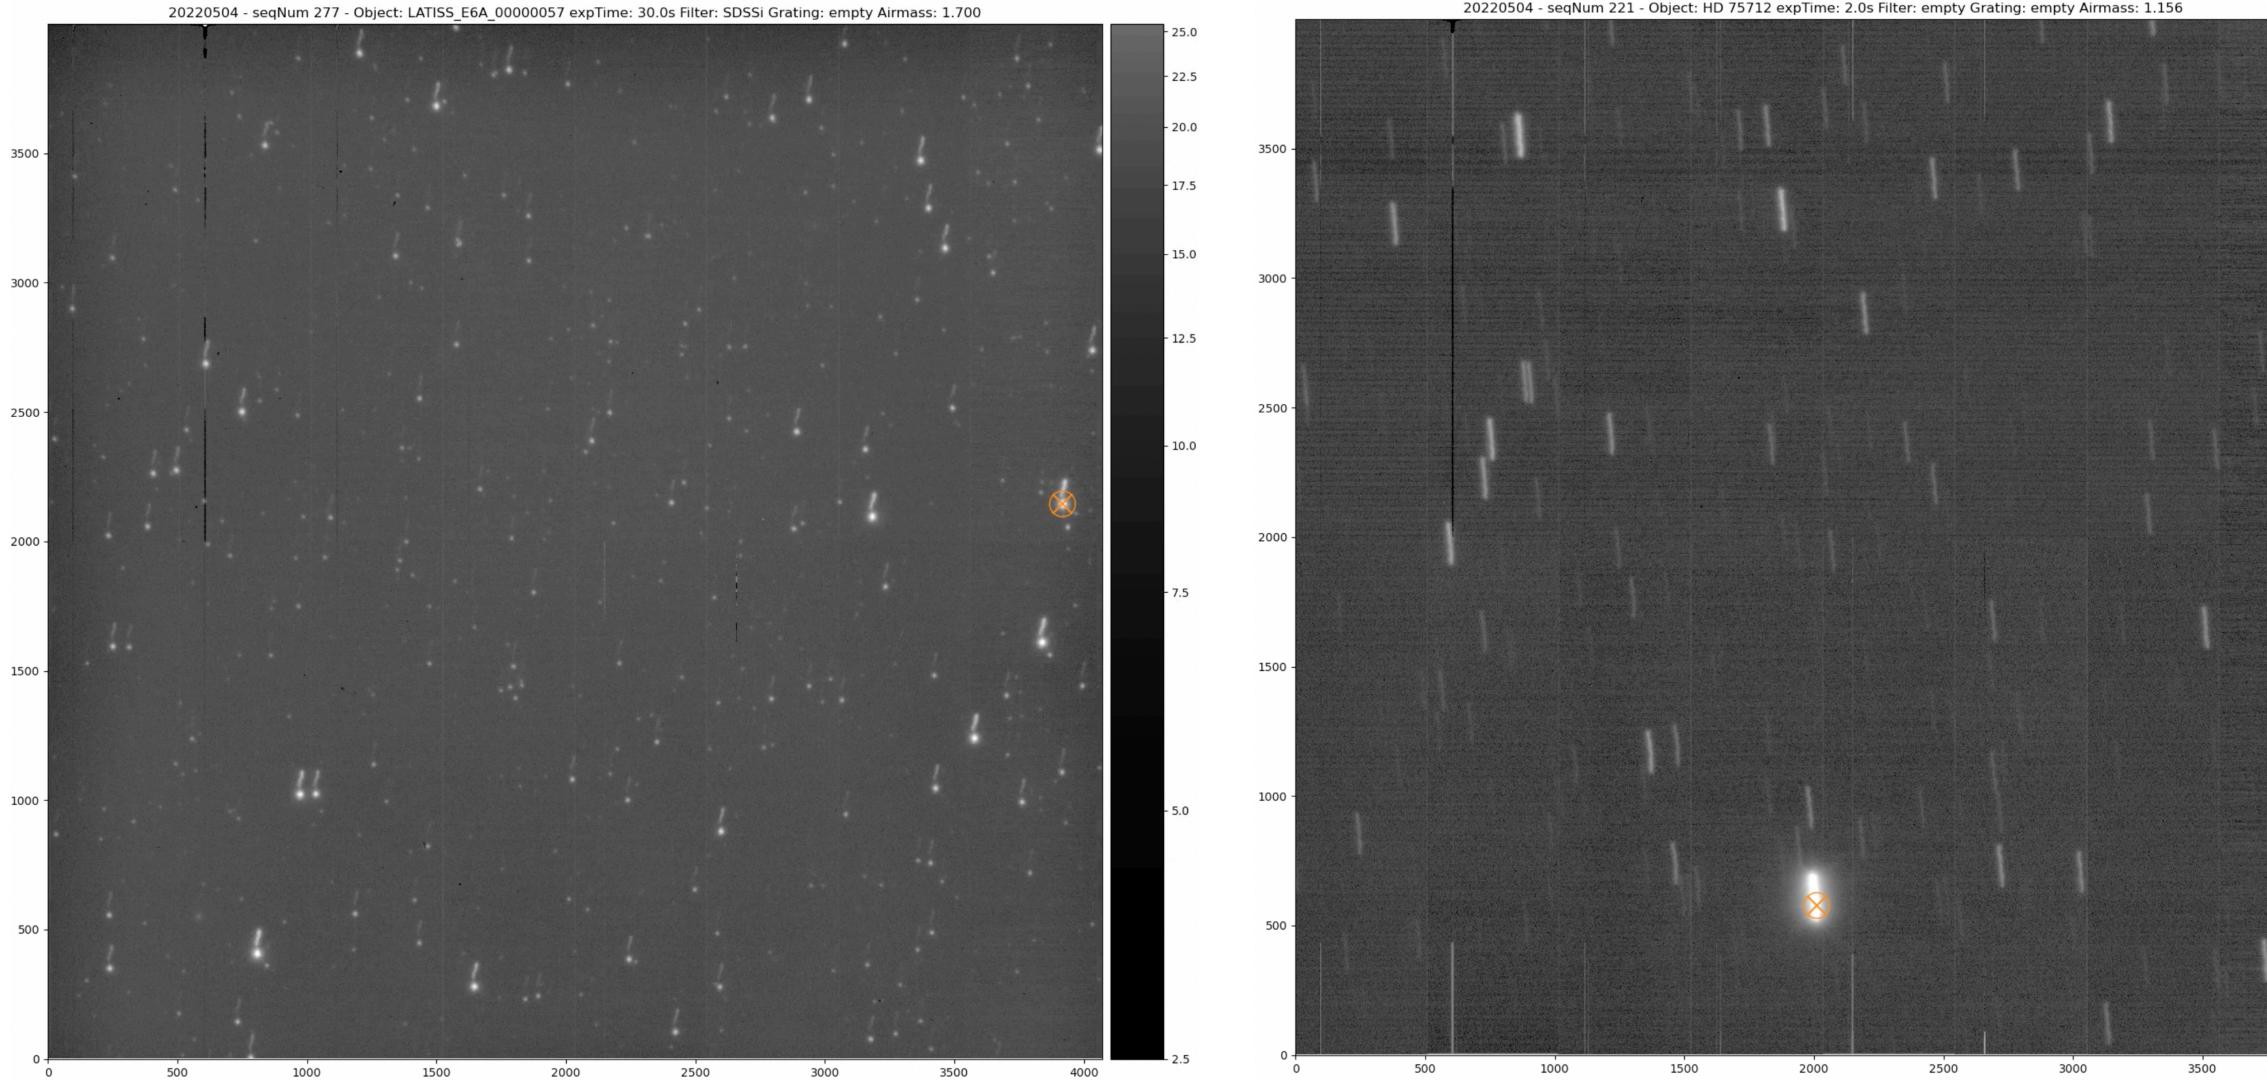

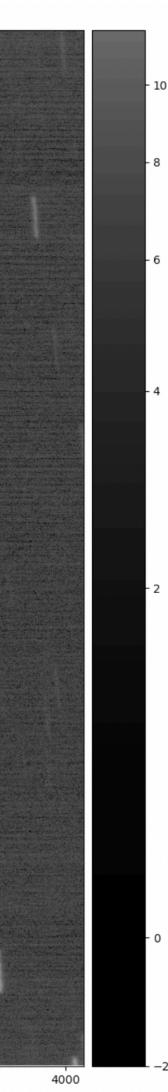

Bernstein, Armstrong, Plazas+17
